Wizardry & Alchemy

Immersive VR GAME

Procedurally Generated Dungeons

by
Gregory Chia Ming Feng
and Justin Liew Jhun Kin

Problem Statement

Many VR games struggle with **shallow mechanics**, **uncomfortable controls** and **weak replay value**.

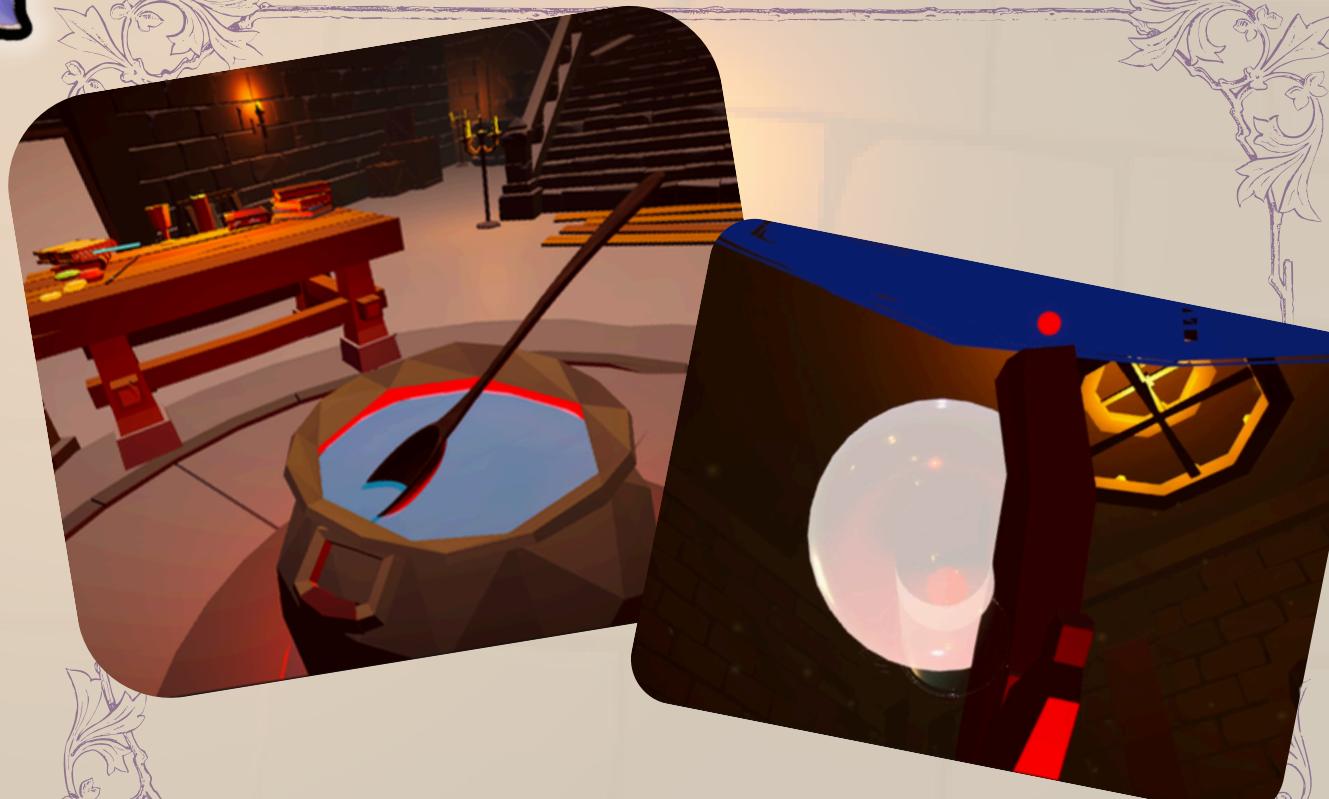

Fantasy VR titles often focus on visuals but lack meaningful **interaction or progression**. Mysteria aims to solve this by combining intuitive spellcasting, potion brewing and exploration to create a more immersive and engaging experience.

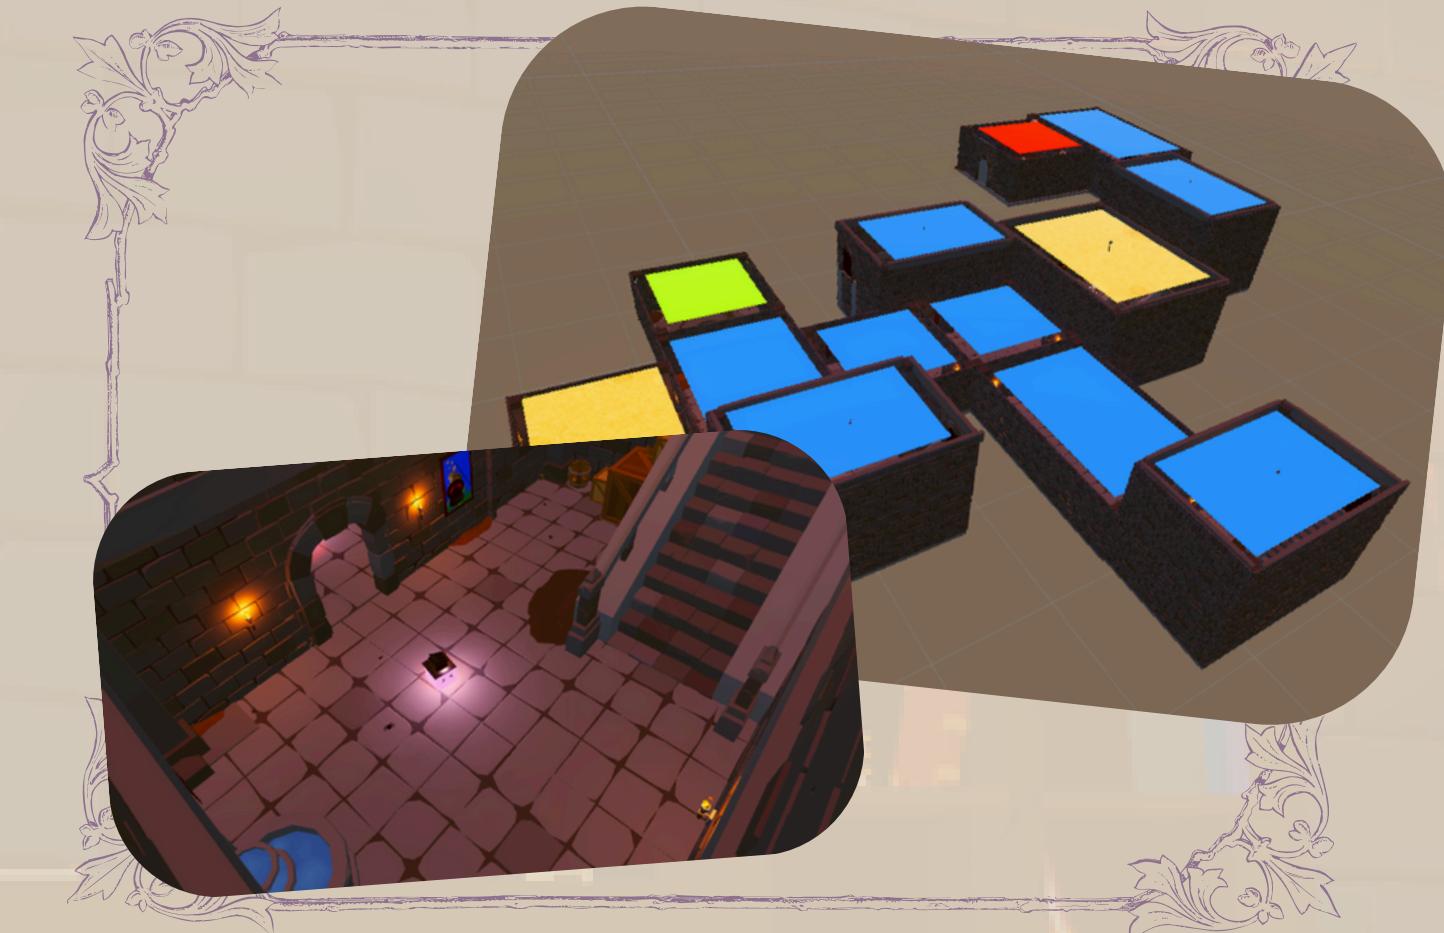

Many VR games struggle with **replayability** because **handcrafted levels become predictable after a few playthroughs**.

Simple grid or random-placement generators tend to produce **overlapping geometry**, or **missing key spaces**, which immediately disrupts immersion and experience in VR.

Objectives

- Create **intuitive and comfortable VR controls** for immersive wizarding.
- Design a gameplay loop & mechanics to maintain **long-term engagement** and replay
- Explore how **VR can enhance immersion** through interactive systems.

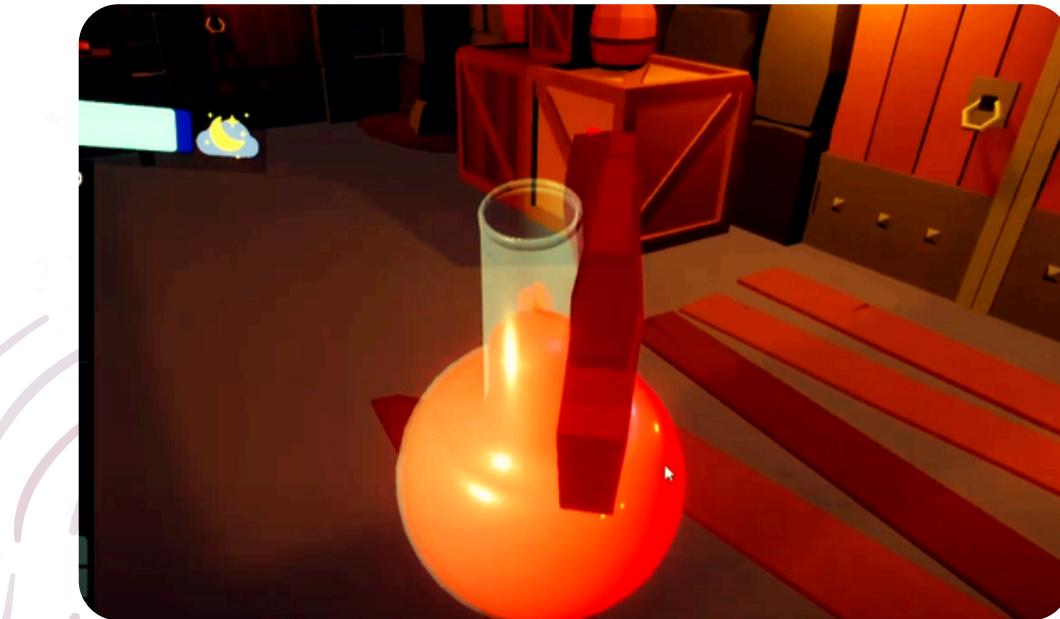

- Develop a **collision-based, connector-based** dungeon generator from modular prefabs.
- Ensure **variety** and replayability while maintaining **navigable, immersive spaces** for VR.
- Integrate **confirmed rooms** for key gameplay spaces.
- Implement an exit room system with sealed unused connectors to preserve believability.
